Activities to develop Shoulder Stability

Wheelbarrow Walks

The child places his hands on the ground whilst someone holds his legs up. Slowly walk forwards like a 'wheelbarrow', keeping hands flat on the ground with

fingers pointing forwards. Make sure that the child is being adequately supported according to his ability, i.e. hold at the hips if he requires more support, & just above the knees as his strength and control improves.

Donkey Kicks

Place hands and feet on the floor with

knees slightly bent. Using both feet at the same time, kick upwards as high as you can. Do these

kicks slowly in order to maintain adequate postural control over the movements, stopping for 2 seconds between each kick. Donkey kicks can also be done on a trampoline or a sprung mattress.

The child is to assume the

Crabwalking

'crab' position i.e. seated, knees bent with feet on the ground, hands on the floor behind them. Then raise his bottom off the floor so that his tummy is flat, and the child is instructed to walk in a variety of directions i.e. forwards, backwards, sideways to the left and right in circles. A beanbag can be placed on the child's tummy to encourage postural control.

Walk up the Wall

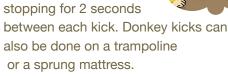

The child stands with his back against the wall. Take one big step forwards, place hands on the floor and lift one leg to place foot on the wall. Slowly lift the other leg and attempt to climb higher up the wall using legs and feet.

Place hands and feet on the

Arm Wrestles

floor with knees slightly bent. Using both feet at the same time, kick upwards as high as you can. Do these kicks

slowly in order to maintain adequate postural control over the movements,

The child should be

encouraged to carry

heavy loads such as

shopping bags full of

school bag or backpack,

equipment etc. Pushing and pulling heavy loads such as a pram or

wheelbarrow also helps to

groceries, ta loaded

garden or household

promote shoulder

stability.

Carrying Heavy Loads

Tug-of-War

Play tug-of-war using a twisted towel. Stand or sit opposite each other and see who can pull the hardest. Ensure that the child is pulling with his arms and not leaning backwards to pull with his body weight.

Heavy work

This activity is ideal to do with a sibling or friend. One child sits in a large cardboard box, while the other child pushes him across the room and then pulls him back. This activity is ideally done on the grass, a carpet or slippery floor. Instead of another child sitting in

> the box, it can also be filled with sand bags or other heavy objects.

Playground Equipment

Having fun on playground equipment such as swings, a seesaw, climbing frames, ladders and monkey bars is ideal for promoting shoulder stability.

Animal Walks

B

The child pretends to be a dog or

cat (crawls on the floor); a
bear (walk on hands and feet)
or tries bunny hops (jumping
with hands and feet).
